Hi,

I am trying to install a cpanel for VPS version onto my VPS divided using openvz. the osteamplate I used is centos-default. at first it went smoothly, but then it starts to output

```
.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....
```

and it just keeps going, it's been 5+ hours now, and it's still going. the system resources changes, so the machine didn't freeze. it's a dual xeon 3.0 box, I gave the VPS about 1GB of memory, and quite a bit of CPUs. Is this normal?

Here's my openvz configuration:

```
ONBOOT="yes"
```

```
# UBC parameters (in form of barrier:limit)
```

```
# Primary parameters
```

```
AVNUMPROC="400:400"

Does anyone have any ideas?

any help is appreciated!

Thank you!

Nick
