Hi Kir,

many thanks for your reply.

> What makes you think so?

I install current kernel RPM on a Fedora 3 dedicated root server from remote. Then the server does not boot. (The only thing i can see from remote is there is nothing in /var/log/dmesg).

Install procedure gives warning about module raid1 not available (but i thinkt it is build-in).

The hosting company recomend when kernel is changed to change to at least 2.6.14, hw may not work with other, they said.
