Now I understand, that you're not using DNAT/SNAT (Destination Network Address Translation/Source Network Address Translation). =)

Thus you're using virtual eth0:0, eth0:1,... you can't use --netdev\_add. The other way to save IPs is bridging. Andrey will tell you how to set up such configuration in few minutes.

Quote: When I ping to a certain host I get a response time of 25ms out of the HWNode. If I ping out of the VPS the response time is around 350ms!

Can you traceroute packages from VE and from HN? May be they go through different routes?

Thanks.
