According to lspci, seems, that there is only one network device on your node... (btw, I meant `lspci -n`, not `lapci -n`, so sorry for missprint   )

If only one interface presents, then why "eth1" in modprobe.conf then?.. (not "eth0"). Ok, I hope the last step of out small investigation.
Post here `ifconfig -a` output. You can replace IP addresses by x.x.x.x for security purposes.

Thanks.

P.S. Is it free for you to reboot the remote node? I mean, if we'll do an experiment and it won't succeded - is it ok?
