As I've found through posts like this...

[http://forum.openvz.org/index.php?t=msg&goto=2687#msg\\_26\\_87](http://forum.openvz.org/index.php?t=msg&goto=2687#msg_26_87)

... is that in order to calculate the CPU usage of an individual VPS, you had to do some calculation based on the vestats file.

So, being that I needed a utility to do this calculation so I could optimize my individual VPS, I created one. Into it, I added the individual VPS memory usage.

Maybe this will be of some interest to the more curious people, so I'll post it:

<http://www.cubedthree.com/projects/openvz/openvzmon.c>

If you have any questions, comments or suggestions about how to modify or improve the utility, they would be very much appreciated!
