Hi Vass,

your trick made it work. Thank you very much. After loading the rule on the HW node and removing it again, it worked inside the VE (with both tcp and udp).

After rebooting the HW node, it stopped working again, so for now I add and remove one rule with the --dport option in it via startup script.

Does anybody have an explanation why this is necessary?

BTW, I am running 2.6.16-026test017 with iptables v1.3.3.

Regards,

Rudi
