Have anyone figured out a way to let the VPS with Gentoo Template to reboot when typed in reboot from the VPS shell?

When I typed in reboot in the VPS's shell, the vps stops, but it never came backup. I had to restart it from the SSH of my root account on the phsycial node.

VPS with fedora or centos, or even openSUSE template seems to be working fine. My cron reboot file is set to cron every minute.

any ideas on what files I had to add/edit in Gentoo template to enable reboot command within the VPS?

Thanks for any help!
