Christoph,

There had been multiple discussions in the past (as recent as Aug 18, 2006), where we (Paul and CKRM/RG folks) have concluded that cpuset and resource management are orthogonal features.

cpuset provides "resource isolation", and what we, the resource management guys want is work-conserving resource control.

cpuset partitions resource and hence the resource that are assigned to a node is not available for other cpuset, which is not good for "resource management".

<ul> <li>&gt;</li></ul>	<ul> <li>&gt; We use the term container to indicate a structure against which we track</li> <li>&gt; and charge utilization of system resources like memory, tasks etc for a</li> <li>&gt; workload. Containers will allow system admins to customize the</li> <li>&gt; underlying platform for different applications based on their</li> <li>&gt; performance and HW resource utilization needs. Containers contain</li> <li>&gt; enough infrastructure to allow optimal resource utilization without</li> <li>&gt; bogging down rest of the kernel. A system admin should be able to</li> <li>&gt; create, manage and free containers easily.</li> <li>&gt; Right thats what cpusets do and it has been working fine for years. Maybe</li> <li>&gt; Paul can help you if you find anything missing in the existing means to</li> <li>&gt; control resources.</li> </ul>
