Quote:It does fail to mention the possibility to use \$VEID though.

Well, I suppose the logic of man developers was something like that:
the persons looks at manpage about vps.conf, observes there:

Quote:

```
VE_ROOT="directory"
```

Corresponds to the --root option.

than moves to manpage about vzctl and discover there \$VEID:

Quote:

```
--root path
```

Sets the path to root directory for this VPS. This is essentially a mount point for VPS root. Value must contain string \$VEID, which will be substituted with numeric VPS ID. Changing this parameter is not recommended, better edit vz(5) global configurationfile.

As concerns

Quote:

This made me wonder: how wold you formulate a generic VETH= line, where some bytes of the MAC address are VEID-derived thus unique?

Sorry. I don't understand you quite. AFAIK MAC address for veth device can be set by user with hand, no relationship with VEID...
