Subject: Re: OpenVZ cpu / mem monitor
Posted by jasonaward on Thu, 21 Sep 2006 14:04:15 GMT

For those of you who care, I made a couple of changes to the monitor. They include:

1) added optional parameter -n which is the number of iterations of information the monitor will display before terminating (similar to the normal 'top' n parameter)

2) added optional parameter -d which is the delay between refreshes in seconds as an integer value (similar to the normal 'top' d parameter) -- which is good when you're debugging something, set -d1.

3) added optional parameter -o which is only used for debugging purposes. When using this parameter it outputs a debug.txt file containing the jiffies consumed for each user/nice/syst/idle. Not really useful unless you find a bug and want to report it to me.

The link above should still work.

Let me know if you guys have any questions or comments. Thanks!
