Having the same problem and have used this post to solve the majority of issues, however, after doing the above I find the following:

from the HM and NOT looged in as root (or Su'ed)

nmap VPSName finds port 25 is open and
telnet VPSName 25 gets a response.

from the HM and logged in as root (or SU'ed)

nmap complains that "the Note: Host seems down. If it is really up, but blocking our ping probes, try -P0"
telnet VPSName gets a response...

from anywhere else on the network

nmap VPSName complains (see above)
telnet VPSName 25 gets "could not open connection to the host on port 25: connect failed"

yet ping VPSName does get a response

Have verified that this IP address is NOT in use elsewhere on the network.

Any ideas???
