The CPU usage was corrected sometime this afternoon. It should work correctly now.

As for the memory, it's working for everyone else who has tested it, but that doesn't mean it's working correctly for you. It's calculated based on your barrier in your /proc/user\_beancounters file. It's based off of the first script found here:

[http://wiki.vpslink.com/index.php?title=Memory\\_Utilization\\_Script](http://wiki.vpslink.com/index.php?title=Memory_Utilization_Script)

If you are having issues with it, however, if possible, please post your user\_beancounters file, and we can go from there (or at least the lines vmguar and privvm).

Thanks!
