Well, that explains why the memory isn't working for me. I assumed that that figure was read from the systems physical memory and swap. I'm oversubscribing the server since I'm the only one who is using it. I know that all of the services aren't going to make me run out of memory and I'm too lazy to map out exactly what each VM is going to need. No matter, I know how much RAM+Swap I have so the current usage is really all I need to see.

As to the CPU usage, has the .c file in the first post been updated yet? If so, it's still not working for me as I just downloaded it again and recompiled. While building PHP in a VM, I see a steady 100% idle.
