Paul,

Think about what will be available to customer through a distro.

There are two (competing) memory controllers in the kernel. But, distro can turn only one ON. Which in turn mean

- there will be a debate from the two controller users/advocates with the distro (headache to distro) about which one to turn ON
- one party will not get what they want and hence no point in them getting the feature into the mainline in the first place (dissatisfaction of the users/original implementors of one solution).

So, IMHO, it is better to sort out the differences before we get things in mainline kernel.

Chandra Seetharaman | Be careful what you choose....
- sekharan@us.ibm.com |you may get it.
