I created a Gentoo Template and it seems to be working fine except for if I type "reboot" The vps shuts down fine but never comes back up. I tried manually running the reboot cron job and it still did not start. I created a CentOS guest and rebooted that vps and it did come back up so It's not a problem with the cron job. There must be something which has to be added to the gentoo template or the gentoo scripts in
`/etc/sysconfig/vz-scripts/dists/scripts`

Anyone have any suggestions?
