Hi, When I try installing the OpenVZ kernel from the RPM I get the following error (WARNING: No module sata_mv found for kernel <version>, continuing anyway) how do I fix this? I am running RHEL 4 - 32 Bit and the RPMs I've used are (ovzkernel-smp-2.6.9-023stab016.2.i686.rpm) and (ovzkernel-smp-2.6.16-026test018.1.i686.rpm) they are all giving me the same error. My server is an "AMD Opteron 248" and "Hitachi DeskStar SATAII HDT722525DLA380 HD". How do I fix this?
Thank You
