Subject: *SOLVED* Source IP within VE
Posted by marcot on Fri, 29 Sep 2006 21:02:50 GMT

Hi *,

here comes a noob question wrt. routing .

Let´s say i´ve got the host running on 11.22.33.44 (first public IP), and my webserver within a VE with a public IP (second public IP).

When going through the logs or tracing packages by tcpdump all packages arriving carry the IP of my host rather than of the client requesting the webpage (somehow obvious).

However, i´d like to have the client´s IP logged within the Apache logs...

Any clue / hint on how to set up transparent routing accordingly ?

I´m using the venet device and have added the public IP as an additional IP to venet within the host environment.

Rgds,
Marco
