marcot wrote on Fri, 29 September 2006 17:02: Let's say I've got the host running on 11.22.33.44 (first public IP), and my webserver within a VE with a public IP (second public IP).

When going through the logs or tracing packages by tcpdump all packages arriving carry the IP of my host rather than of the client requesting the webpage (somehow obvious).

However, I'd like to have the client's IP logged within the Apache logs...

Apache logs the client IP for me, and I don't do anything special to make it happen.

Quote: Any clue / hint on how to set up transparent routing accordingly ?

I'm using the venet device and have added the public IP as an additional IP to venet within the host environment.

Don't do that. OpenVZ automatically publishes an ARP entry for you.
