Hi,

Is there a particular script that runs and sets the environment, etc. for the shell when you vzctl into a server.

I notice that when I'm in the hardware node I have my regular bash enviroment but when I vzctl enter into a ve it is all set to blank:

```
bash-3.00# env
TERM=screen
PWD=/
SHLVL=1
HOME=/
HISTFILE=/dev/null
_=/bin/env
```

Can I edit this to set a preferred set of vars?

Thanks!
