
Subject: ***SOLVED*** Broken VPS problem

Hello,

I'm running openvz with 2.6.8-022stab064-up using debian sarge on the hardware node for several months. Everything has worked fine until I did an apt-get update and an apt-get upgrade on the hardware node. One of the programs being upgraded was vzctl.

When I rebooted, the virtual private servers did NOT boot.
When I did:

```
vzctl status 101  
VPSID 101 deleted unmounted down
```

```
vzctl start 101  
VPS config file does not exist
```

Both /vz/private/101 and /etc/vz/101.conf still exist, so thankfully the files haven't been deleted.

Could someone help me correct this problem.

Thank you.
