Subject: Packet loss problem
Posted by enigmaYmee on Thu, 05 Oct 2006 05:20:46 GMT

I'm new to Openvz and have searched for the answer to this problem but have had no luck.

I'm testing Openvz on my home server running gentoo. Using the stable openvz sources the problem I'm seeing is that after rebooting into the newly compiled kernel everything works fine except for network traffic. I get about 50% packet loss and the RTT for the responces is about 4000ms. This is on a 100mb switch.

I've also tried compiling with the config file from the openvz website on the download page. I then set the eth0 to 10baseT/half duplex just to try something different with the nic.

Everything I've tried has produced the same result. Is there something that I'm forgetting to do? If you can provide any advice I would very much appreciate it. Also, if there is anymore information about my system you need I can provide it.
