This isn't a vz specific question, realistically you should read about how to monitor system resources and rates in the Linux OS. Obviously, some metric is exhausted. cpu power, memory, disk io, etc.

send us the output of:  
vmstat 5 (let it run for a minute)  
iostat -k 5 (run for a minute)  
free -m

I can probably point you in the right direction.

If you are asking why one vps could be overrunning the entire node, send us the output of:

vzmemcheck -vA  
vzcpucheck -v
