Subject: Question about veth interfaces

Hi,

I have an installed system of OpenVZ and it works very well. One
question that I have is when we stop and start the veth interfaces
(ifdown veth0; ifup veth0;) all the accounts on the system no longer
will accept ssh incoming connections. It almost seems like the routing
on the accounts get changed. Is there a better way to bring down and up
the interfaces in case there is a problem?
