Yep that's what I thought too.
So I tried this scenario:

eth0: 192.168.0.2 255.255.255.0

eth1: 10.10.10.2 255.255.252.0 (a big 10.x.x network)

So I did a route statement on the HN,
route add -host 10.10.10.3 dev venet0

I did the dev on venet0 just like how the vzctl --ipadd command set the ip to venet0. I am not sure
if that's the correct way to route that IP to one of the VE's.

After doing that, I did a vzctl set 100 --ipadd 10.10.10.3

I am able to ping from another machine, 10.10.10.10, but i can not ping from 10.10.10.3 to
10.10.10.10.

So what did I do wrong?

Thanks.
