Dag,

Thank you! I actually use dstat on my Gentoo note.

Speaking of counters, /proc/user_beancounters is of interest to any OpenVZ user. Format is described at http://wiki.openvz.org/proc/user_beancounters. "held" and "failcnt" columns are most "dynamic". You can use the values either directly, or make some consolidated figures based of formulae in wiki.

Other thing that might be of interest is /proc/fairsched{,2}. These files are from OpenVZ Fair CPU scheduler. The only problem is looks like the format is not documented (well, not counting the source code).

Also, Kirill Korotaev will give us some suggestions...
