dev wrote on Sun, 08 January 2006 09:40It's for HTTP/FTP/POP3/SMTP.
each VPS has it's own private IP with HTTP/FTP/SSH daemons.

Do I understand correctly.

I can have one outside IP (routable) and then accept ftp, ssh, pop3, smtp etc. by domain name and route it to it's own internal IP?

I new this was possible with http due to the HTTP 1.1 host header. However I do not understand how the other protocols know which IP to route it to based on the domain name.

Or do I misunderstand what you mean?
