Dag,

To be honest -- I'd love to. I suppose you want Python -- this is fine with me. It'd be great to start from scratch, but be aware that developing/maintaining package management tools leads to endless pain and suffering (I assume you probably know that already:)).

So, we can set up a git repo (and a component in bugzilla) and start working on some "next-generation package management tools".

Although I do not see any problem with "shell-oriented" config files. They are easy to edit and can be easily read from any code (be it C or Perl or Python or whatever). So, can you be more specific and tell us why you don't like such configs?

Finally, I propose to move the discussion to devel@ list (to'ed). If you agree, please reply to devel@ only.
