ferp2 wrote on Tue, 17 October 2006 09:04I only want to remove venet0 from VE 4 (now using the eth1 interface), but leave the venet0 interface functioning on VEs 1, 2 and 3.

You can make your own custom VE scripts.

In /etc/vz/conf, make a new [xxx].conf file, edit it, and set OSTEMPLATE=mydist, where [mydist] is some arbitrary name you like.

Then, in /etc/vz/dists, copy one of the .conf files (whichever one suits your needs) and call it mydist.conf. Edit it, and set ADD_IP=mydist-add_ip.sh and DEL_IP=mydist-del_ip.sh.

Then in etc/vz/dists/scripts, choose a set of -add_ip.sh and -del_ip.sh scripts, and copy them to mydist-add_ip.sh and mydist-del_ip.sh, respectively.

Then start hacking the new scripts. This may require more effort than you had in mind, but once you learn how the scripts work, you can do most anything you want.

I don't know an easier way, maybe someone else does.
