Hi,

On Tue, 17 Oct 2006, Kirill Korotaev wrote:

I want to clarify because I am also interested in something like this:  
will UNIX sockets or FIFOs work between VE and VE0 and between one VE and  
the other if and only if both sides see the node in the filesystem?

If so, is this design goal or something that works for now but could stop  
working some day?

Thanks,

Grzegorz Kulewski
