Hi Vass,

I've followed your recommendation:

Quote:You should add parallel port device to VE using `set <veid> --devnodes` command of `vzctl`.

But `lp0` remains inaccessible to the VE. Only when I start the cups server in the HN can I start to access `lp0` in the VE.

I have also tried the following without success:

1. Manually re-added `lp0` to the VE using the `vzctl set <veid> --devnodes lp0:rw` command.
  2. Restarted the VE.
  3. Restarted cups server in the VE.
  4. Entered `vzctl set <veid> --devnodes lp0:rw --save` and restarted the HN.
