Hi Vass,

I've followed your recommendation:

Quote:You should add parallel port device to VE using set <veid> --devnodes command of vzctl.

But lp0 remains inaccessible to the VE. Only when I start the cups server in the HN can I start to access lp0 in the VE.

I have also tried the following without success:

1. Manually re-added lp0 to the VE using the vzctl set <veid> --devnodes lp0:rw command.
  2. Restarted the VE.
  3. Restarted cups server in the VE.
  4. Entered vzctl set <veid> --devnodes lp0:rw --save and restarted the HN.
