Hello Valmont,

The commands show these info (see attached files).  
It is indeed on the HN node.

In the mean time, i have tried various things related to masquerading and nat, and it seems that i obtain always the same message invalid argument!  
It seems tha the module ipt\_MASQUERADE is not used in the lsmod listing, while with a "normal" kernel (the ipcop kernel) all works fine and the ipt\_MASQUERADE is used OK  
Ah i have also tried to set the ip\_contrack\_enbale\_ve0 option to 1 (even if i know that the kernel 2.6.16 test 18 is already compiled with the support)

What i should try is use a recent iptable binary to see if it works OK or not! And if it doesn't work then...??

Cheers  
Jo
