Guys,

We're currently in the middle of moving to a new datacenter and I haven't work on the project in the past 3 weeks because of it. Our migration hopefully will be completed sometimes this week so I can start working on this project again.

ceelian,

I'll be happy if you or anyone else want to join this project, certainly will make things moving a lot faster.

This is what I currently have so far.

** backend (HN) **
- python based SOAP daemon
- python script to manage access list

** frontend (GUI) **
- PHP5 based
- PHP script with Smarty template engine
- PEAR SOAP (had problem with built in SOAP)
- SQLlite database

PM me what you can do to help and we'll split our responsibility ..

Kir, maybe you can help us with a repository site?

Cheers,
