---

I need to use 2 different networks (local and public) in two different network interfaces on the hardware node. Some of the VEs need to access only to one of these networks (the local network), other VEs need to access to both networks (local and public networks, on different interfaces). I need to use kernel 2.6.8, I saw in other post that veth is only for newer kernels. Can anyone suggest a possible configuration for this case? Thanks!

Fernando
