I did a normal install on a fresh new clean Debian 3.2 (etch):

```
apt-get install kernel-patch-openvz vzctl vzquota
```

No Error... Nothing

I made a reboot and he loaded the following kernel:

```
uname -a  
Linux debian3264m 2.6.16-2-amd64-k8-smp #1 SMP Fri Aug 18 21:10:33 CEST 2006 x86_64  
GNU/Linux
```

I think it's not the OpenVZ-Kernel, but im not sure...

So, the real problem is, that OpenVZ doesn't start:

```
/etc/init.d/vz start  
Starting OpenVZ: ..failed
```

What must i do that it starts correctly?
