can you provide me the details on how to install the kernel after it was compiled with 'make' and reboot to it? When I yesterday rebooted it (to the default kernel! not the built one) it hanged... :/ strange... since I have no any console access I can't diagnose it

If you have 2.6.18 built for T1 somewhere (and working) I can easily apply OVZ patches I have and make it working very quickly.

Thanks,
Kirill
