Hello all,

I checked out the recent topic on ipv6 but still have problem running the tspc's client inside a VE. I've the correct device added (speaking of TUN) as openvpn works perfectly, but still got in trouble with tspc. I think the problem is around the "sit" device so i'm just wondering myself how to use it inside the VE ?

I use a compiled kernel (last development version) with all IPv6 modules ready.

What are the kernel modules needed in this case (tspc) ?

Thank you for your help.
