Hello,

Quote:

1. What does that UBC BUG mean?

this is definitely openVZ kernel BUG. I filled the bug:

http://bugzilla.openvz.org/show_bug.cgi?id=320

You can add your e-mail to CC to follow the progress on the bug.

BTW, if you've compiled the kernel by yourself, then, please, add your .config file to bug report. Thanks!

Quote:2. Would ztdummy have something to do with it?

I have never had this issue before.

ztdummy is a kernel module... And there is no such module in mainstream (vanilla kernel)... So you have compiled it yourself. Where have you got sources for ztdummy?

Quote:

Is there a specific reason why ipt_owner isn't built into the OVZ stab kernel? Is it because it needs to be virtualized to work properly?

Ohhh!... ipt_owner is virtualized, but we just forgot to turn appropriate option on! Thanks, will be fixed in the next kernel!

Good luck,
vass.
