<<<< AFAICS, doing so you introduced a leak of anonymous dentries.

```

d_alloc_anon() calls d_alloc() with parent == NULL, i.e. dentries have no parent and are not linked to the sb->s_root...

BTW, looking at it, I found that s_anon field on super block is not used any more.

we can add BUG_ON(!hlist_empty(&sb->s_anon)) in generic_shutdown_super to avoid such issues like this.

maybe we can fix it adding something like:

```

while (!list_empty(&sb->s_anon))
    prune_dcache(MAX_INT, &sb->s_anon);

```

```
