A race between SIGTERM and startproc is what I thought too. But then I put "sleep 1" between killproc and startproc, and the problem still happens.

The zombie pid is not the old pid that was killed; the old pid number is much lower (not just one lower); I can see that before killing it. The zombie pid is somehow related to the new instance of sendmail, though I am not sure how.

As another data point:

This morning I was using a debian etch VE, running aptitude interactively to install a package. But after downloading, it stalled, and went no further. Then I used another session to look with "ps ax" and I saw another zombie:

```
PID TTY  STAT  TIME COMMAND
  1 ?    Ss    0:00 init [2]
9359 ?   Ss    0:00 /sbin/syslogd
9365 ?   Ss    0:00 /sbin/klogd -x
9377 ?   Ssl   0:00 /usr/sbin/named -u bind
9401 ?   Ss    0:00 /usr/sbin/sshd
9405 ?   Ss    0:00 /usr/sbin/vsftpd
9411 ?   Ss    0:00 /usr/sbin/xinetd -pidfile /var/run/xinetd.pid -stayal
9432 ?   Ss    0:00 /usr/sbin/cron
19964 ?   Ss    0:00 sshd: root@pts/0
19967 pts/0  Ss    0:00 -bash
21510 ?   Ss    0:00 sshd: root@pts/2
21513 pts/2  Ss    0:00 -bash
31876 pts/2  Zl+   0:08 [aptitude] <defunct>
31964 pts/0  R+    0:00 ps ax
```

This never happened to me before, with debian aptitude. Maybe there is some 2.6.18 kernel regression related to PIDs and zombies, but I don't know how to analyze it further.
