Right now, I'm trying to be able to set my routing for veth for the VPS that is starting up. It can only be done after the veth device is created, which is after the 123.mount has already been run.

I don't want to use the /etc/network/interfaces file or the like, because they can't follow the VPS if I move it between HNs on the network, which I do and will do. I really want to be able to run a script like 123.start, but have it run on the HN.
