I have wanted to do this as well. Unfortunately I couldn't find a clean way to run a command in the HN context after a VE starts. What I did was use cron, running a script each minute to accomplish whatever commands you need run. ie, after you run whatever command you are referring to, something probably changes. "check" to see if that change was made with the cron script, if it wasn't, run the command. In my case, it was adding some --devnodes to the started VPS, but I didn't want to maintain a mount-script file for each VE. Hope this helps.
