One thing I was considering was to have the 123.mount script create an "at" job for now+2 minutes and run the 123.netcfg script. It seems dirty, so I'd like to not have to do that.

But whatever I do, it has to be portable to run on all our other servers because we do and will move a VPS around on a regular basis and I do not want to have to reconfigure or hand-edit a config file each time.
