Hi

I have the same problem. As I understood the problem is that there is no default gw after VPS starts.

After some experements found that command "ip route add ..." which is used in "/etc/sysconfig/network-scripts/ifup-routes" isn't work.

```
-bash-3.1# ip route add 191.255.255.0/24 dev venet0 scope host  
RTNETLINK answers: Operation not permitted
```

This is strange because command "route add" works fine.

I modify script ifup-routes to use this command and all start work.

But I think that there is other way to solve this problem.
