Hi

I installed this kernel ovzkernel-smp-2.6.9-023stab032.1.x86_64.rpm on my FC6 and I would like to run samba (3.0.23c-2) but when I try to start it I have this strange error on smb.conf:

Fatal: no entropy gathering module detected

What does it mean?

I'm trying to start samba as domain member with ldap backend

If I start my server with the kernel "standard" I don't have any problems

Help me please
