I want to make a Host Node nat+firewall+router for the entire local network with a portion of them DMZed. How is that achievable in a home network?

Currently I have a network like this based on CentOS4:

DSLModem->WirelessRouter-->connected simultaneously
to-->>VoIPServerWithWebInterface-->>WebServerBasedOnOpenVZ-- >>LocalNetwork (wireless and wired both)

Do I need to change the network like this to make the HN as a router and firewall to the entire local network?

DSLModem->WebServerBasedOnOpenVZwithHostNodeServing as
Router-->>WirelessRouterForLocalNetwork-->connected simultaneously
to-->>VoIPServerWithWebInterface-->>LocalNetwork (wireless and wired both)

Please advise which firewall or router is ideal for such environment except iptables. Thanks.
