Well it seems it may be an openvz issue after all.

It's been a while now and the crash didn't occur again but a weird thing happened.

I had an apache server installed on the HN to try a vps management php script but i dropped the idea at that time. The server was still running and it was set to start with the HN. After some work i've done on the HN that involved restarting the machine i noticed the webserver started on the HN and stopped it.

At first i didn't notice but the phones started ringing. All apache servers in the vps's were stopped !

I stumbled on this same issue with a qmail server left on the HN that interfered with another one installed in a vps.

As a rule of thumb it is best NOT to run any services on the HN that may be running in a vps !
