Thanks! Still don't get it

My situation of the HN / VE HN powernode = 204589 VE cpuunits = 120000

Now the guide cpulimit: (allowed VPS CPUUNITS/CPU power)*100%.

Becomes: (120000/204589)*100% = 0,344

I don't see the link for the value 200 / 400 for cpulimit. Or am I doing/reading something wrong?
