Here is something I have never touched on. I do know that bug fixes and new features from OpenVZ seem to make a direct translation to the Virtuozzo project, but I have a few questions. Will the UltraSparc64 port be making its way into the Virtuozzo product? I am hoping so. Virtuozzo has several important extra functions added to make it a very strong system for mass virtualization, so in my opinion, when dealing with using virtualization to provide a commercial service, to make the most cost effective offering, Virtuozzo comes into the picture. In other words, in the near future, Virtuozzo supporting UltraSparc64 will be a welcome change.
