Hello list

I am trying to mount an additional disk which is ext3 file system inside VE.

kernel version 2.6.9-023stab032.1

vzctl version 3.0.13

Hard ware node OS Centos4.3

but, I ve' got an error message like

```
develop(VE):/dev/vdisk # mkfs -j /dev/vdisk/disk1
develop(VE):/dev/vdisk # mount -t ext3 /dev/vdisk/disk1 /mnt/disk1
mount: wrong fs type, bad option, bad superblock on /dev/vdisk/disk1,
      missing codepage or other error
In some cases useful info is found in syslog - try
dmesg | tail or so
```

then ended up using -t ext2 option instead of ext3.

```
develop:/ # mount -t ext2 /dev/vdisk/disk1 /mnt/disk1
develop(VE):/ # df
Filesystem      1K-blocks    Used Available Use% Mounted on
/dev/simfs        874428   333940   335260  50% /
tmpfs            158732       0   158732  0% /dev/shm
/dev/vdisk/disk1  1007896   17672  939024  2% /mnt/disk1
```

this is kind of werard....

Are there any work around for this ?

Hiro
